RESOLVED ISSUES

This patch resolves the following issues:

- Saved reports cannot be updated when certain fields are used.
- In some situations, Network address inheritance refresh jobs and Data Deduplication jobs are failing with the error: "data.maintenance.query.HCP is empty".
- Record profiles that contain many objects load slowly.

  The following updates were made to improve page loading performance:

  - **Sub-objects** - Each sub-object loads independently to help loading time. When you click a summary card, a spinner displays until the card is loaded.

  - **Updates to primaries** - When you set a different sub-object as the primary, the card for the current primary no longer opens. Previously, that card opened so you could see that the primary value was updated to *No/False*. The change is still made but, to help performance, the card remains closed.
  - **Chrome OS** - Users running this operating system will see an overlay on profiles until the page completely loads. Use the overlay to view the record profile until the page is loaded and can be actioned.
