Veeva Network 25R2.1.2 Patch Release Notes

October 2025

Contents

Issues resolved in this release3

Issues resolved in this release

This patch resolves the following issues:

- **Send to OpenData** - After a locally managed HCO is sent to OpenData to manage, an HCP's parent relationship is not repointed when the new OpenData HCO is downloaded to your Network instance. The existing relationship remains pointed to the now invalid locally managed HCO.

This issue does not fix existing relationships.

To fix existing relationships, manually repoint the relationship from the invalid local HCO to the valid OpenData HCO.

- **Search widget** - Widget users are redirected to the Search page when they try to edit an account profile to add an affiliation.
