Issues resolved in this release3

Issues resolved in this release

This patch resolves the following issues:

- **Job Impact Dashboard** - Job queries can time out if they produce a very large number of results.
- **Data model object configuration** - Translation issues can occur on the object definition when the user's language is set to Chinese.
- **Security vulnerability** - An internal security audit identified a path traversal risk where unvalidated input could allow access to sensitive local information in some situations.
