Updates in this release

ISSUES RESOLVED

This patch resolves the following issue:

- **Configuration management** - In some situations, profile layouts and data visibility profiles that are exported from a source environment are not imported to the target environment.

FEATURE REMOVED

The following 26R1.1 feature is removed:

- **Vault CRM credential** - To proactively ensure seamless operations and prevent any potential environment disruptions, the Vault CRM credential type has been removed from the Network MDM UI.

This new credential type supported the Network System Owned User introduced in Vault CRM 26R1.3. The Network System Owned User functionality was removed in Vault CRM 26R1.4.

Impact

- **No disruption to existing integrations** - Customers can continue to securely connect to Vault CRM using the existing Vault credential type in their Vault CRM Bridge configurations.
