ENHANCEMENTS

Unsubscribed OpenData records

To prevent unintended records from being downloaded, OpenData records that have been merged with a (losing) record that was unsubscribed in your Network instance will no longer be downloaded.

Previously, a merge winner could be downloaded to your Network instance if the losing record was unsubscribed (record state is set to Deleted) but had been affiliated to an already downloaded record in your Network instance.

Supported OpenData jobs

This enhancement applies to OpenData country subscriptions only.

It does not apply to ad hoc download jobs (Ad Hoc Download, Download from OpenData, Sync with OpenData). You can continue to choose to resubscribe to records using these methods.

Enable this enhancement

This change is enabled by default in your Network instance.

RESOLVED ISSUES

This patch resolves the following issues:

- **Network Explorer** - Incorrect object icons display.
- **Job triggers** - Subscription configurations cannot be opened if they contain a job trigger to start a disabled subscription.
- **Profile page** - The **Source Keys** heading remains in loading state on the Summary Header if custom keys are not included in the profile layout.
